Abstract:

Choosing the right course is an important decision for students, as it can directly influence their academic performance, skill development, and future career opportunities. However, the large number of courses available across different disciplines makes it difficult for students to identify courses that match their interests, academic background, skills, and career goals. Traditional course selection methods often rely on general academic guidelines or manual counseling, which can be time-consuming and may not provide personalized recommendations for every student.

To address this problem, the proposed **Student Course Recommendation System** uses machine learning and recommendation techniques to provide personalized course suggestions based on student-related information. The system analyzes factors such as academic performance, subject preferences, skills, interests, previous courses, and career objectives to identify suitable courses. Data preprocessing and feature selection techniques are applied to improve the quality of the input data, while machine-learning-based recommendation methods are used to determine the most relevant courses for each student.

The proposed system can classify and rank courses according to their suitability for individual students. By analyzing patterns among student profiles and previously selected or completed courses, the system can recommend courses that are more closely aligned with a student's abilities and interests. The recommendation process can also consider course difficulty, prerequisites, academic performance, and career-oriented skills.

The **Student Course Recommendation System** aims to reduce the complexity of course selection and provide students with accurate, efficient, and personalized academic guidance. The system can assist students in making informed decisions while also helping educational institutions improve academic advising and student engagement. Overall, the proposed approach demonstrates the potential of artificial intelligence and machine learning to provide intelligent, personalized, and data-driven course recommendations.
